

WANTED

Android and Web Developer

I have a prototype for a Telephone Call Blocking program. The program helps manage robocallers, bill collectors, political calls and other miscreants. It is similar to Hiya, Nomorobo and RoboKiller but with several additional features. The primary use case is seniors 50 and over who use land lines and have little computer knowledge. They are a vulnerable segment who are actively preyed upon. The zero-conf use case has a lot of challenges.

The program runs on low-end dev-boards and desktop computers. Low-end dev-boards are important to keep the cost around \$20 to \$30 USD. Long term plans are to give the devices away to seniors through a tax exempt or non-profit organization.

The project needs an Android specialist and a Web specialist. The Android specialist will create the Android app and port features. The Web specialist will improve the website and provide a web-based front-end for configuration over wifi. The website is located at <https://www.callboot.net>.

Other tasks include designing a logo, improving voice commands, integrating with two carrier databases through web services and finalizing a case design for manufacture. Contribute where you can.

Meetups will happen on occasion at places like the Green Turtle and Green Valley Marketplace. We eat and discuss the project.

Please contact me if you are a self motivated problem solver and interested in joining the project. No background checks, only problem solvers.
